

**You can't give your customers a crystal ball,
but you can help them see trouble coming.**

Their satisfaction and your reputation turns on every rotation.

By integrating rugged and reliable speed monitoring devices from Electro-Sensors into your processing or handling systems, your customers are able to spot problems in shaft-driven components before things take a turn for the worse. Which makes your systems more reliable and a better value.

The original digital speed switch. We pioneered machine monitoring over 35 years ago, and our field-proven technology is still the most durable and reliable—even in extreme conditions. With the largest, most forgiving gap and alignment tolerances, we can help prevent overload, slippage or damage to rotating shaft components before it can occur. And now our systems are even easier to install.

You can't predict the future. Or can you?

For a free catalog and speed monitoring tutorial, call 1-800-328-6170, or go to www.electro-sensors.com. We know trouble when we see it.
